The high-pressure ammonia vapor is condensed (in SCCE/SSCE) or adsorbed (in SRES) and rejects useful heat. Once the system gets to low pressure, useful heat is extracted from the MT and the system starts to adsorb vapor ammonia. The ammonia in LT is released, taking in LT heat from the cold ambient.

The cGas Ammonia Vent Line Detector is designed for continuous monitoring of ammonia levels in the vent line of refrigeration systems, including the detection of equipment failure in ammonia plant vent stack applications.
