Na-ion batteries, as the representative technology of energy storage, play a key role for decarbonization. A great success on the materials and battery design is reported in this manuscript where manganese, sodium, and biomass-derived carbon could afford the challenge to construct sustainable and cost-effective Na-ion batteries for stationary ...

The world's energy landscape is very complex. Fossil fuels, especially because of hydraulic fracturing, are still a mainstay of global energy production, but renewable energy sources, such as wind, solar, and others, are increasing in importance for global energy sustainability. Experts and non-experts agree that the next game-changer in this area will be energy storage. Energy ...

This, in turn, may include compressed air energy storage, battery energy storage, thermal energy storage, hydrogen, and ammonia storage. Furthermore, the issue seeks contributions that cover the integration of these components into modernized electrical energy systems to support the direct connection of low-to-no-carbon energy to consumers and ...

Grid extension and diesel generators have long been the primary modes of rural electrification in developing countries []. However, these modes show their limitations in addressing rural electrification challenges in the developing world [6-8]. On the other hand, various studies have highlighted distributed hybrid renewable energy systems (HRESs) as a more ...
